DATE MAILED: 05/17/2005

Please find below and/or attached an Office communication concerning this application or proceeding.

Office Action Summary

Application No.

10/012,466

Applicant(s)

RICHARD ET AL.

Examiner

Hanh B. Thai

Art Unit

2161

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on amendment filed 4/26/05.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-15 and 18-39 is/are pending in the application.
- 4a) Of the above claim(s) \_\_\_\_\_ is/are withdrawn from consideration.
- 5) ☐ Claim(s) \_\_\_\_\_ is/are allowed.
- 6) ☒ Claim(s) 1-15 and 18-39 is/are rejected.
- 7) ☐ Claim(s) \_\_\_\_\_ is/are objected to.
- 8) ☐ Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on \_\_\_\_\_ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.  
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).  
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some \* c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
2. ☐ Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.
3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

\* See the attached detailed Office action for a list of the certified copies not received.

Attachment(s)

- 1) ☒ Notice of References Cited (PTO-892)
- 2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)
- 3) ☐ Information Disclosure Statement(s) (PTO-1449 or PTO/SB/08)  
Paper No(s)/Mail Date \_\_\_\_\_.
- 4) ☐ Interview Summary (PTO-413)  
Paper No(s)/Mail Date. \_\_\_\_\_.
- 5) ☐ Notice of Informal Patent Application (PTO-152)
- 6) ☐ Other: \_\_\_\_\_.

## DETAILED ACTION

### *Response to Arguments*

Applicant's arguments with respect to claims 1-39 have been considered but are moot in view of the new ground(s) of rejection.

### *Claim Rejections - 35 USC § 103*

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

1. Claims 1-15 and 18-39 are rejected under 35 U.S.C. 103(a) as being unpatentable over Whiting et al. (U. S. Patent no. 5,778,395) of record in view of Midgley et al. (US 5,485,606).

Regarding claims 1, 12-13 and 23, Whiting discloses a process for indexing files residing on a computer as part of backup operation, comprising the steps of:

- executing one or more periodic backup operations on the files, said backup operation including the step of scanning the files (see col. 3, line 7-48 and col. 14, line 45-49, Whiting);
- using said scanning operation to derive a set of word data indexes for subsequent use in obtaining direct access to said files (see col.4, line 25-32, col. 5, line 45-46 and col. 14, line 48-51, Whiting).

Whiting, however, does not disclose the word data indexes provides an access to the files based on the word data content of the files. Midgley, on the other hand, discloses the system and method for storing and retrieving files for archival purposes including a

Art Unit: 2161

control words which determine how an operating system processes the data words or access information which allows a user access to data file (summary and col. 5, lines 46-67, Midgdey). It would have been obvious to one of ordinary skill in the art at the time of the invention was made to modify Whiting to include the claimed feature as taught by Midgdey. The motivation of doing so would have been to improve the efficiency of the backup process.

Regarding claim 2, Whiting/Midgdey combination further discloses the restoring of many files from the backup (see 4. line 46-50 and col. 5, line 41-46, Whiting) and the files including system files, program files and other files. Therefore, these files must contain both text-processing files and compound files.

Regarding claim 3, Whiting/Midgdey combination further discloses a centralized environment where a server (100, Fig. 1, Whiting) is associated with a database (101, Fig. 1, Whiting), said database adapted to store backup files and wherein said server substantially simultaneously carries out the backup and the indexing of the files (see col. 6, line 21-32; col. 10, line 39-65 and col. 14, line 26-42, Whiting).

Regarding claim 4, Whiting/Midgdey combination further discloses the step of generating a centralized table of indexes loaded on said server (col.3, lines 49-53 and col.4, line 59 to col.5, line 2, Whiting).

Regarding claim 5, Whiting/Midgdey combination further discloses that the access rights are defined for each file including at least one indexing right that is used for controlling the indexing process of the files within the centralized table of indexes (col.3, line 49-53; col.4, lines 25-27 and line 59 to col.5; col.7, lines 24-31, line 2, Whiting).

Regarding claim 6, Whiting/Midgdey combination further discloses a first indexing attribute which authorizes the indexing of a given file within the centralized index; and a second indexing attribute defining selective access to that file (Fig.22 and corresponding text, Midgdey. The “index” and “new index” corresponds to first and second index with value attribute).

Regarding claim 7, Whiting/Midgdey combination further discloses the backup of files residing on a first machine, said server transmits to the first machine a local table of indexes representative of the different documents stored on that first machine (see col. 14, line 49-54, Whiting).

Regarding claim 8, Whiting/Midgdey combination further discloses that the transfer of the files which are to be backed up uses the Hyper Text Transfer (H.T.T.P.), RCP, FTP or the like protocols (see col. 13, line 31-38, Whiting).

Regarding claims 9-10, Whiting/Midgdey combination further discloses that the files correspond to system and/or user files and the indexing is performed in relation to the user files (see Fig. 3 and corresponding text, Whiting).

Regarding claim 11, Whiting/Midgdey combination further discloses

- initiating a search request for a given file, said request containing a set of key words or indexes (see col. 5, line 3-34 and col.13, line 11-36, Whiting);
- processing said search request by reference to a first local table of indexes stored on one of said plurality of computers in order to locate a first set of relevant files extracted from said one computer (col.17, line 5 to col. 18, line 35, Whiting);
- processing, upon request from the user, an additional search within said centralized index loaded into said server for the purpose of obtaining any

additional results corresponding to files stored on the backup database (see col. 8, line 8-20, Whiting).

- displaying the result of said additional search and, for each or any file having a selective access attribute, automatically generating an electronic mail to be sent to a corresponding originator of said file for the purpose of requesting access to said file (see col. 35, line 44-63, Whiting).

Whiting, however, does not disclose the requesting access to the. Midgdey, on the other hand, discloses the system and method for storing and retrieving files for archival purposes including a control words which determine how an operating system processes the data words or access information which allows a user access to data file (summary and col. 5, lines 46-67, Midgdey). It would have been obvious to one of ordinary skill in the art at the time of the invention was made to modify Whiting to include the claimed feature as taught by Midgdey. The motivation of doing so would have been to improve the efficiency of the backup process.

Regarding claim 14, Whiting discloses a knowledge-base system for indexing files residing on a computing system as part of a backup operation comprising:

- means for regularly backing up files stored on computers connected to or constituting a network (see col. 3, line 7-48 and col. 7, line 8-31, Whiting);
- means for substantially simultaneously indexing the files during the backup procedure for the purpose of creating and updating a database of backup files and documents as well as a centralized index of backed up documents (see col.4,

Art Unit: 2161

line 59 to col.5, line 19; col. 14, line 26-65; Fig. 3 and corresponding text, Whiting).

Whiting, however, does not disclose the accessing to the backup files based on the word data content of the backed-up documents. Midgdey, on the other hand, discloses the system and method for storing and retrieving files for archival purposes including a control words which determine how an operating system processes the data words or access information which allows a user access to data file (summary and col. 5, lines 46-67, Midgdey). It would have been obvious to one of ordinary skill in the art at the time of the invention was made to modify Whiting to include the claimed feature as taught by Midgdey. The motivation of doing so would have been to improve the efficiency of the backup process.

Regarding claim 15, Whiting discloses a backup process for a stand-alone computer comprising:

- opening each file which is to be backed up;
- while opening said file, compiling a set of indexes characterizing said files and which will be incorporated into a table of indexes (see col. 14, line 38-43, Whiting);
- closing said file upon completion of said backup and said indexing operation (see col. 14, line 26-65; Fig. 3 and corresponding text, Whiting).

Whiting, however, does not disclose a set of word data indexes characterizing the files. Midgdey, on the other hand, discloses the system and method for storing and retrieving files for archival purposes including a control words which determine how an operating

system processes the data words or access information which allows a user access to data file (summary and col. 5, lines 46-67, Midgdey). It would have been obvious to one of ordinary skill in the art at the time of the invention was made to modify Whiting to include the claimed feature as taught by Midgdey. The motivation of doing so would have been to improve the efficiency of the backup process.

Regarding claims 18, 21 and 31, Whiting discloses a process for indexing files residing on a plurality of computers as part of a backup operation attached to, or constituting a network for the purpose of generating a centralized table of indexes for use in obtaining direct access to said files, the table being stored on a server associated with a database adapted to store backup files, comprising the steps of:

- executing repeated backup operations on the files, said backup operations including the step of scanning the files (see col. 3, line 33-48 and col. 14, line 45-49, Whiting);
- using the scanning operation to derive a set of itemized indexes, wherein the server substantially simultaneously carries out the backup and the indexing of the files (see col. 4, line 25-30, col. 5, line 45-46 and col. 14, line 45-49, Whiting).

Whiting, however, does not disclose the word data indexes provide access to the files based on the word data content of the files. Midgdey, on the other hand, discloses the system and method for storing and retrieving files for archival purposes including a control words which determine how an operating system processes the data words or access information which allows a user access to data file (summary and col. 5, lines 46-

67, Midgdey). It would have been obvious to one of ordinary skill in the art at the time of the invention was made to modify Whiting to include the claimed feature as taught by Midgdey. The motivation of doing so would have been to improve the efficiency of the backup process.

Regarding claim 19, Whiting/Midgdey combination further discloses that the access rights are defined for each file including at least one indexing right that is used for controlling the indexing process of the files within the centralized table of indexes (col.3, line 49-53; col.4, lines 25-27 and line 59 to col.5; col.7, lines 24-31, line 2, Whiting).

Regarding claims 20 and 22, Whiting/Midgdey combination further discloses a first indexing attribute which authorizes the indexing of a given file within the centralized index (Fig.22 and corresponding text, Midgdey. The “index” and “new index” corresponds to first and second index with value attribute).

Regarding claim 24, Whiting further discloses a centralized environment where a server (100, Fig. 1, Whiting) is associated with a database (101, Fig. 1, Whiting), said database adapted to store backup files and wherein said server substantially simultaneously carries out the backup and the indexing of the files (see col. 6, line 21-32; col. 10, line 39-65 and col. 14, line 26-42, Whiting).

Regarding claim 25, Whiting further discloses the step of generating a centralized table of indexes stored on said server (col.3, line 49-53; col.4, lines 25-27 and line 59 to col.5; col.7, lines 24-31, line 2, Whiting).

Art Unit: 2161

Regarding claim 26, Whiting further discloses the control of access rights that are defined for each file including at least one indexing right (col.3, line 49-53; col.4, lines 25-27 and line 59 to col.5; col.7, lines 24-31, line 2, Whiting).

Regarding claim 27, Whiting further discloses the at least one indexing right includes: a first indexing attribute which authorizes the indexing of a given file within the centralized index; and a second indexing attribute defining selective access to that file (col.3, lines 49-53 and col.4, line 59 to col.5, line 31, Whiting).

Regarding claim 28, Whiting further discloses that the program code elements are arranged to transmit to a computer a local table of indexes representative of the different files stored on that computer after completion of the backup of files residing on that computer (see col. 14, line 49-54, Whiting).

Regarding claims 29 and 37, Whiting discloses a server associated with a database adapted to store backup files and comprising program code elements for indexing files residing on a plurality of computers as part of a backup operation attached to, or constituting a network for the purpose of generating a centralized table of indexes for use in obtaining direct access to said files, said program code elements comprising:

- program code element to execute repeated backup operations on the files, said backup operations including the step of scanning the files (see col. 3, line 33-48 and col. 14, line 45-49, Whiting);
- program code element that uses said scanning operation to derive a set of itemized indexes, wherein the server substantially simultaneously carries out the

backup and the indexing of the files (see col. 4, line 25-30, col. 5, line 45-46 and col. 14, line 45-49, Whiting).

Whiting, however, does not disclose the word data indexes provide access to the files based on the word data content of the files. Midgdey, on the other hand, discloses the system and method for storing and retrieving files for archival purposes including a control words which determine how an operating system processes the data words or access information which allows a user access to data file (summary and col. 5, lines 46-67, Midgdey). It would have been obvious to one of ordinary skill in the art at the time of the invention was made to modify Whiting to include the claimed feature as taught by Midgdey. The motivation of doing so would have been to improve the efficiency of the backup process.

Regarding claims 30 and 38, Whiting/Midgdey combination further discloses the at least one indexing right includes: a first indexing attribute which authorizes the indexing of a given file within the centralized index; and a second indexing attribute defining selective access to that file (Fig.22 and corresponding text and col.3, line 49-53; col.4, lines 25-27 and line 59 to col.5; col.7, lines 24-31, line 2, Midgdey. The “index” and “new index” corresponds to first and second index with value attribute).

Regarding claim 32, Whiting/Midgdey combination further discloses a centralized environment where a server (100, Fig. 1, Whiting) is associated with a database (101, Fig. 1, Whiting), said database adapted to store backup files and wherein said server substantially simultaneously carries out the backup and the indexing of the files (see col. 6, line 21-32; col. 10, line 39-65 and col. 14, line 26-42, Whiting).

Regarding claim 33, Whiting/Midgdey combination further discloses the step of generating a centralized table of indexes stored on said server (col.3, line 49-53; col.4, lines 25-27 and line 59 to col.5; col.7, lines 24-31, line 2, Whiting).

Regarding claim 34, Whiting/Midgdey combination further discloses that the access rights are defined for each file including at least one indexing right that is used for controlling the indexing process of the files within the centralized table of indexes (col.3, line 49-53; col.4, lines 25-27 and line 59 to col.5; col.7, lines 24-31, line 2, Whiting).

Regarding claim 35, Whiting/Midgdey combination further discloses a first indexing attribute which authorizes the indexing of a given file within the centralized index; and a second indexing attribute defining selective access to that file (Fig.22 and corresponding text, Midgdey. The "index" and "new index" corresponds to first and second index with value attribute).

Regarding claim 36, Whiting/Midgdey combination further discloses that the program code elements are arranged to transmit to a computer a local table of indexes representative of the different files stored on that computer after completion of the backup of files residing on that computer (see col. 14, line 49-54, Whiting).

Regarding claim 39, Whiting discloses a program product for backing up files within a network of computers, comprising:

(a) computer program code stored on a computer readable medium adapted, when executed on a computer, (i) to execute one or more repeated backup operations on files stored on a computer, said backup operation including the step of scanning the files (see col. 3, line 33-48 and col. 14, line 45-49, Whiting); and (ii) to substantially simultaneously derive using said

Art Unit: 2161

scanning operation a set of word data indexes (see col. 4, line 25-30, col. 5, line 45-46 and col. 14, line 45-49, Whiting); and

(b) computer program code stored on a computer readable medium adapted, when executed on a computer, to search for a file stored on a plurality of computers connected to, or constituting, a network within such a set of itemized indexes (see col. 5, line 3-34 and col. 13, line 11-36, Whiting), by (i) initiating a search request for a given file, said request containing a set of key words or indexes, (ii) processing said search request by reference to a first local table of indexes stored on one of said plurality of computers in order to locate a first set of relevant files extracted from said one computer (col. 17, line 5 to col. 18, line 35, Whiting); (iii) processing an additional search within a centralized index on a server (col. 6, line 21-32; col. 10, line 39-65 and col. 14, line 26-42, Whiting) for the purpose of obtaining any additional results corresponding to files stored on the backup database (see col. 8, line 8-20, Whiting), (iv) displaying the result of said additional search (see col. 35, line 44-63, Whiting).

Whiting, however, does not disclose the word data indexes provide access to the files based on the word data content of the files. Midgdey, on the other hand, discloses the system and method for storing and retrieving files for archival purposes including a control words which determine how an operating system processes the data words or access information which allows a user access to data file (summary and col. 5, lines 46-67, Midgdey). It would have been obvious to one of ordinary skill in the art at the time of the invention was made to modify Whiting to include the claimed feature as taught by Midgdey. The motivation of doing so would have been to improve the efficiency of the backup process.
